

Cloud Content Security Gateway (CCSG)

FIRSTWAVE
CLOUD SECURITY TECHNOLOGY

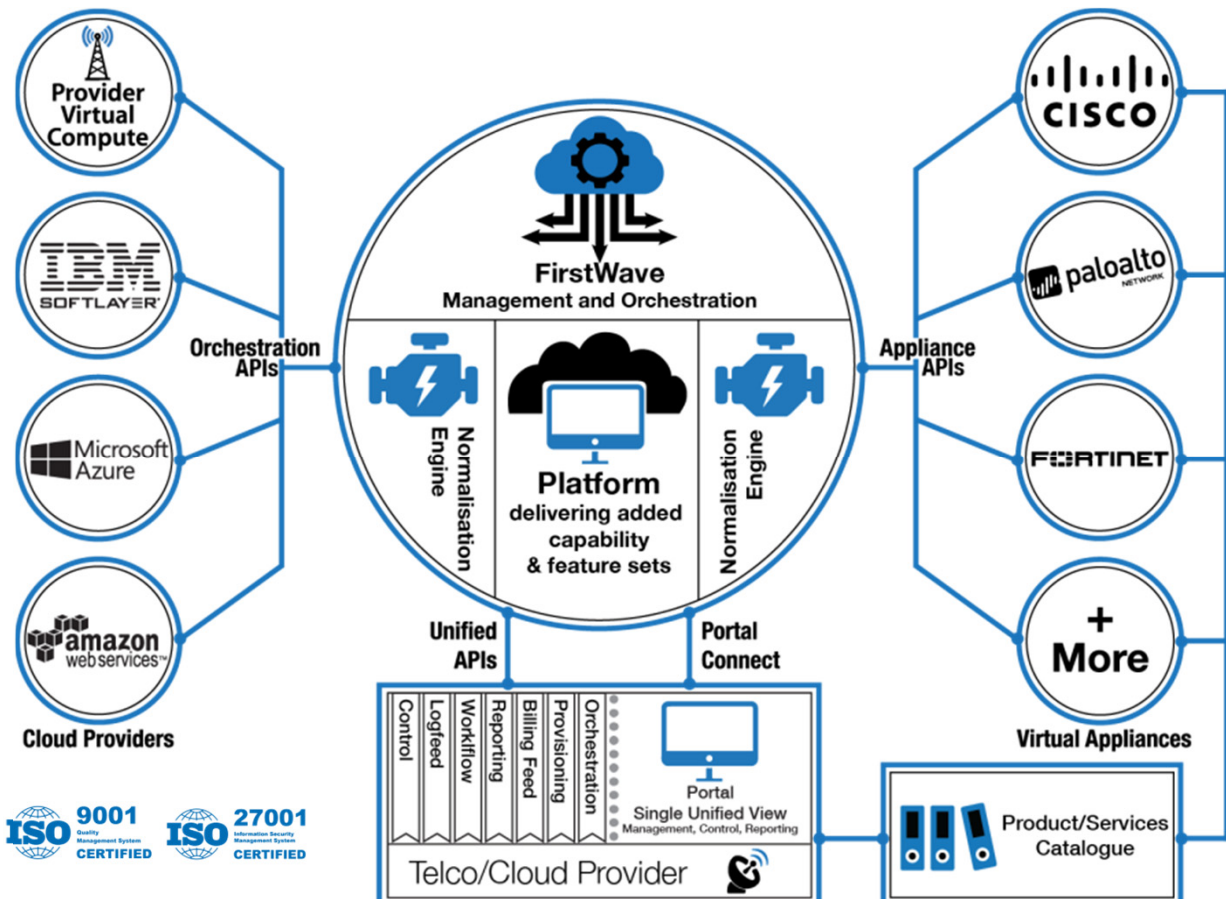

Full virtualised, vendor neutral, security management and orchestration platform

FirstWave has developed a fully virtualised management and orchestration platform for the delivery of cloud security gateways. The FirstWave Cloud Content Security Gateway (CCSG) is a platform designed to enable and support innovative, differentiated, high-value, replicable, 'low-touch' cloud-based content security & analytics services, including targeted customised solutions for the unique requirements of today's service providers.

The platform uses an integrated reference architecture with a security vendor technology accreditation and integration model. It sits on fully extensible architecture that employs machine learning with supervised and semi-supervised learning techniques for classification purposes. The development is RAD, or 'Agile Dev Ops' based and includes 'Big Data' and content extraction processing.

BENEFITS

- **Total integrated management** of security policies and reports with centralized online management & self-managed apps. A robust, scalable, flexible, reference architecture - proven in a telco environment
- **Global solution** - The ability to provide cloud based vNGFW, email & web filtering services cost effectively & globally which can be extended to physical appliances.
- **Rapid deployment** and remote provisioning
- **Feature rich APIs** for extensive integration possibilities
- **Single pane of glass** management portal
- **Multi-cloud** 'normalised', automated deployment
- **Standardised customer security policy deployment** across an entire customer's infrastructure.
- **Consolidated log and event processing**
- **Platform and node flexibility**, portability and extensibility.
