

Email Security

Perfect for small business

Rapidly blocks, quarantines, investigates, and remediates email cyber-attacks.

With malware, phishing and ransomware attacks becoming more sophisticated and frequent, businesses must bolster their security against rising threats. Considering how vital it is for companies to protect their personal details and financial integrity, CyberCision Email Security with Advanced Detection and Response (ADR) protects your email service both Inbound and Outbound. Our solution uses Cisco's ESA/Ironport and Advanced Malware Protection (AMP) technologies, recognized as a market leader by Gartner, IDC and Radicati. Additionally, ADR has been built with a unique application of Security Information and Event Management (SIEM) technology, security engineering and advanced threat research and intelligence, including Dark Web monitoring and over 10 leading sources of threat intelligence.

CyberCision Email Security with ADR secures inbound email from malware, ransomware, phishing, viruses and spam and also detects advanced persistent threats such as spear phishing, whaling, typo domain and spoofing attacks. In addition to the perimeter security, our ADR addition analyses all email cyber security events across a business with contextualised threat intelligence to automatically detect targeted threats and orchestrate policy-

Perfect for businesses who cannot afford managed security services

Protects against zero-day and advanced phishing attacks targeted at specific businesses or workers/employees

Provides automated incident response and recommendations

ADR automatically uncovers and stops elusive threats with agility and precision

Powered by world's leading solutions for small business

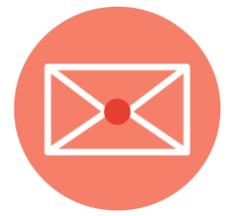

FirstWave

Email Security

Perfect for small business

Why choose Email Security?

A proven and affordable inbound and outbound email security solution

Centralised visibility and control is provided so you can discover incursions through emails

Perfect for businesses who cannot afford managed security services

Advanced access, visibility, and role based controls for easier content management.

Protects against zero-day and advanced phishing attacks targeted at specific businesses and their employees

Data Loss Prevention through guaranteed backup as per compliance standards

Outbound DKIM: Easy generation of key and signature

Provides automated incident response and recommendations

Cisco AMP - Defence against advanced persistent threats and ransomware attacks

24x7 Security Monitoring and Threat Detection

Ensured 100% uptime using redundant and fault tolerant infrastructure

Easy integration with Microsoft 365, Google Workspace, on-premises Exchange, and other email solutions

Advanced protection against key attacker techniques

Phishing Attack

Protects against attacks where a bad actor sends a cleverly crafted phishing email to a targeted user in the business which contains a link that takes the user to a newly setup legitimate looking domain/web page

Account Takeover

External Impersonation

Protects against attacks where a partner of a business has had email credentials stolen and the bad actor launches a targeted impersonation email attack

Business Email Compromise

Protects against attacks where a bad actor poses as a key executive to send a cleverly and convincingly worded email to a staff member to perform an urgent money transfer or payment

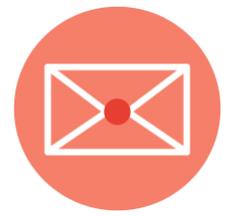

Account Takeover

Internal Impersonation

Protects against attacks when the bad actor has stolen the users email credentials and logs into business email account to launch an attack

Email Security

Perfect for small business

Comprehensive email security at and inside the perimeter:
